Problem statement

Nowadays sedentary lifestyle is a very common among youth and adult people. Continuously sitting for long hours without any movement or motion may lead to multiple lifestyle diseases in human being [1,2]. It is because of lack of awareness among them regarding their health. The study primarily focuses on identifying the risk factor of lifestyle diseases caused due to these lifestyle habits.

Objective

- Identify the pattern of disease growth on the basis of lifestyle habits.
- Identify relationships between lifestyle habits and diseases
- Visualise the identified patterns from the data for quick and meaningful understanding using data visualisation techniques.
- Predict the type of disease that person might get with a precision score.

Methodology

- We will be extracting and collate data from authentic sites like Kaggle, WHO website, CDC, etc [3,4,5,6] to retrieve health parameters like Sleep cycle, obesity, physical activity, food consumption patterns, nutrition present in the consumed food, blood pressure, body mass index, smoking alcohol, sugar consumption, etc..

- Data will be pre-processed followed by application of data visualization methods and machine learning models for identifying disease patterns.
- We will apply EDA, data mining techniques, data visualisation technique, filtration, rectification and pattern identification on data.

Expected Outcomes

- Emerging disease patterns due to lifestyle habits
- Identification of correlation between disease and lifestyle habits
- Advise appropriate diagnosis to improve individual's health by examining their lifestyle habits.
